

# 1 Notations

- The symbol  $\underline{\underline{\text{const}}}$  for `const`.
- The symbol  $\curvearrowright$  for *function returned value*.
- Template class parameters lead by outlined character. For example: `T`, `Key`, `Compare`. Interpreted in template definition context.
- Sometimes `class`, `typename` dropped.
- Template class parameters dropped, thus `C` sometimes used instead of `C(T)`.
- “See example” by  $\Rightarrow$ , its output by  $\Rightarrow \Rightarrow$ .

# 2 Containers

## 2.1 Pair

```
#include <utility>
```

```
template(class T1, class T2)
struct pair {
    T1 first; T2 second;
    pair() {}
    pair( $\underline{\underline{\text{const}}}$  T1& a,  $\underline{\underline{\text{const}}}$  T2& b):
        first(a), second(b) {} };
```

### 2.1.1 Types

```
pair::first_type
pair::second_type
```

### 2.1.2 Functions & Operators

See also 2.2.3.

```
pair(T1,T2)
make_pair( $\underline{\underline{\text{const}}}$  T1&,
           $\underline{\underline{\text{const}}}$  T2&);
```

## 2.2 Containers — Common

Here `X` is any of  
`{vector, deque, list,`  
`set, multiset, map, multimap}`

### 2.2.1 Types

```
X::value_type
X::reference
X::const_reference
X::iterator
X::const_iterator
X::reverse_iterator
X::const_reverse_iterator
X::difference_type
X::size_type
```

Iterators reference `value_type` (See 6).

## 2.2.2 Members & Operators

```
X::X();
X::X( $\underline{\underline{\text{const}}}$  X&);
X::~X();
X& X::operator=( $\underline{\underline{\text{const}}}$  X&);

X::iterator      X::begin();
X::const_iterator X::begin()  $\underline{\underline{\text{const}}}$ ;
X::iterator      X::end();
X::const_iterator X::end()  $\underline{\underline{\text{const}}}$ ;
X::reverse_iterator X::rbegin();
X::const_reverse_iterator X::rbegin()  $\underline{\underline{\text{const}}}$ ;
X::reverse_iterator X::rend();
X::const_reverse_iterator X::rend()  $\underline{\underline{\text{const}}}$ ;

X::size_type X::size()  $\underline{\underline{\text{const}}}$ ;
X::size_type X::max_size()  $\underline{\underline{\text{const}}}$ ;
bool         X::empty()  $\underline{\underline{\text{const}}}$ ;
void          X::swap(X& x);
void X::clear();
```

### 2.2.3 Comparison Operators

Let, `X v, w`. `X` may also be `pair` (2.1).

```
v == w           v != w
v < w           v > w
v <= w          v >= w
```

All done lexicographically and  $\curvearrowright$ bool.

## 2.3 Sequence Containers

`S` is any of `{vector, deque, list}`

### 2.3.1 Constructors

```
S::S(S::size_type n,
       $\underline{\underline{\text{const}}}$  S::value_type& t);
S::S(S::const_iterator first,
      S::const_iterator last);  $\Rightarrow$  7.2, 7.3
```

### 2.3.2 Members

```
S::iterator // inserted copy
S::insert(S::iterator before,
           $\underline{\underline{\text{const}}}$  S::value_type& val);
S::iterator // inserted copy
S::insert(S::iterator before,
          S::size_type nVal,
           $\underline{\underline{\text{const}}}$  S::value_type& val);
S::iterator // inserted copy
S::insert(S::iterator before,
          S::const_iterator first,
          S::const_iterator last);
S::iterator S::erase(S::iterator position);
```

```
S::iterator S::erase(S::const_iterator first,
                      $\curvearrowright$  post erased S::const_iterator last);
void S::push_back( $\underline{\underline{\text{const}}}$  S::value_type& x);
void S::pop_back();
S::reference S::front();
S::const_reference S::front()  $\underline{\underline{\text{const}}}$ ;
S::reference S::back();
S::const_reference S::back()  $\underline{\underline{\text{const}}}$ ;
```

## 2.4 Vector

```
#include <vector>
```

```
template(class T,
        class Alloc=allocator)
class vector;
```

See also 2.2 and 2.3.

```
size_type vector::capacity()  $\underline{\underline{\text{const}}}$ ;
void vector::reserve(size_type n);
vector::reference
vector::operator[](size_type i);
vector::const_reference
vector::operator[](size_type i)  $\underline{\underline{\text{const}}}$ ;
 $\Rightarrow$  7.1.
```

## 2.5 Deque

```
#include <deque>
```

```
template(class T,
        class Alloc=allocator)
class deque;
```

Has all of `vector` functionality (see 2.4).

```
void deque::push_front( $\underline{\underline{\text{const}}}$  T& x);
void deque::pop_front();
```

## 2.6 List

```
#include <list>
```

```
template(class T,
        class Alloc=allocator)
class list;
```

See also 2.2 and 2.3.

```
void list::pop_front();
void list::push_front( $\underline{\underline{\text{const}}}$  T& x);
void // move all x (&x  $\neq$  this) before pos
list::splice(iterator pos, list(T)& x);  $\Rightarrow$  7.2
void // move x's xElemPos before pos
list::splice(iterator pos,
             list(T)& x,
             iterator xElemPos);  $\Rightarrow$  7.2
```

```
void // move x's [xFirst,xLast) before pos
list::splice(iterator pos,
             list(T)& x,
             iterator xFirst,
             iterator xLast);  $\Rightarrow$  7.2
```

```
void list::remove( $\underline{\underline{\text{const}}}$  T& value);
void list::remove_if(Predicate pred);
// after call:  $\forall$  this iterator p, *p  $\neq$  *(p + 1)
void list::unique(); // remove repeats
void // as before but, ~binPred(*p, *(p + 1))
list::unique(BinaryPredicate binPred);
// Assuming both this and x sorted
void list::merge(list(T)& x);
// merge and assume sorted by cmp
void list::merge(list(T)& x, Compare cmp);
void list::reverse();
void list::sort();
void list::sort(Compare cmp);
```

## 2.7 Sorted Associative

Here `A` any of  
`{set, multiset, map, multimap}`.

### 2.7.1 Types

For `A=[multi]set`, columns are the same

<code>A::key_type</code>	<code>A::value_type</code>
<code>A::keycompare</code>	<code>A::value_compare</code>

### 2.7.2 Constructors

<code>A::A(Compare c=Compare())</code>	
<code>A::A(A::const_iterator first,</code>	<code>A::const_iterator last,</code>
<code>Compare c=Compare());</code>	

### 2.7.3 Members

<code>A::keycompare</code>	<code>A::key_comp() <math>\underline{\underline{\text{const}}}</math></code>
<code>A::value_compare</code>	<code>A::value_comp() <math>\underline{\underline{\text{const}}}</math></code>
<code>A::iterator</code>	
<code>A::insert(A::iterator hint,</code>	<code><math>\underline{\underline{\text{const}}}</math> A::value_type&amp; val);</code>
<code>void A::insert(A::iterator first,</code>	<code>A::iterator last);</code>
<code>A::size_type // # erased</code>	
<code>A::erase(<math>\underline{\underline{\text{const}}}</math> A::key_type&amp; k);</code>	
<code>void A::erase(A::iterator p);</code>	
<code>void A::erase(A::iterator first,</code>	<code>A::iterator last);</code>
<code>A::size_type</code>	
<code>A::count(<math>\underline{\underline{\text{const}}}</math> A::key_type&amp; k) <math>\underline{\underline{\text{const}}}</math></code>	
<code>A::iterator A::find(<math>\underline{\underline{\text{const}}}</math> A::key_type&amp; k) <math>\underline{\underline{\text{const}}}</math></code>	

```
A::iterator
A::lower_bound(const A::key_type& k) const;
A::iterator
A::upper_bound(const A::key_type& k) const;
pair<A::iterator, A::iterator> // see 4.3.1
A::equal_range(const A::key_type& k) const;
```

## 2.8 Set

#include <set>

```
template<class Key,
         class Compare=less(Key),
         class Allocator>
class set;
```

See also 2.2 and 2.7.

```
set::set(const Compare& cmp=Compare());
pair<set::iterator, bool> // bool = if new
set::insert(const set::value_type& x);
```

## 2.9 Multiset

#include <multiset.h>

```
template<class Key,
         class Compare=less(Key),
         class Allocator>
class multiset;
```

See also 2.2 and 2.7.

```
multiset::multiset(
    const Compare& cmp=Compare());
multiset::multiset(
    InputIterator first,
    InputIterator last,
    const Compare& cmp=Compare());
multiset::iterator // inserted copy
multiset::insert(const multiset::value_type& x);
```

## 2.10 Map

#include <map>

```
template<class Key, class T,
         class Compare=less(Key),
         class Allocator>
class map;
```

See also 2.2 and 2.7.

### 2.10.1 Types

map::value\_type // pair(const Key, T)

## 2.10.2 Members

```
map::map(
    const Compare& cmp=Compare());
pair<map::iterator, bool> // bool = if new
map::insert(const map::value_type& x);
T& map::operator[](const map::key_type& k);
map::const_iterator
map::lower_bound(
    const map::key_type& k) const;
map::const_iterator
map::upper_bound(
    const map::key_type& k) const;
pair<map::const_iterator, map::const_iterator>
map::equal_range(
    const map::key_type& k) const;
```

### Example

```
typedef map<string, int> MSI;
MSI nam2num;
nam2num.insert(MSI::value_type("one", 1));
nam2num.insert(MSI::value_type("two", 2));
nam2num.insert(MSI::value_type("three", 3));
int n3 = nam2num["one"] + nam2num["two"];
cout << n3 << " called ";
for (MSI::const_iterator i = nam2num.begin();
     i != nam2num.end(); ++i)
    if ((*i).second == n3)
        cout << (*i).first << endl;}
```

④ 3 called three

## 2.11 Multimap

#include <multimap.h>

```
template<class Key, class T,
         class Compare=less(Key),
         class Allocator>
class multimap;
```

See also 2.2 and 2.7.

### 2.11.1 Types

multimap::value\_type // pair(const Key, T)

### 2.11.2 Members

```
multimap::multimap(
    const Compare& cmp=Compare());
multimap::multimap(
    InputIterator first,
    InputIterator last,
    const Compare& cmp=Compare());
```

```
multimap::const_iterator
multimap::lower_bound(
    const multimap::key_type& k) const;
multimap::const_iterator
multimap::upper_bound(
    const multimap::key_type& k) const;
pair<multimap::const_iterator,
      multimap::const_iterator>
multimap::equal_range(
    const multimap::key_type& k) const;
```

## 3 Container Adaptors

### 3.1 Stack Adaptor

#include <stack>

```
template<class T,
         class Container=deque(T) >
class stack;
```

Default constructor. Container must have back(), push\_back(), pop\_back(). So vector, list and deque can be used.

```
bool stack::empty() const;
Container::size_type stack::size() const;
void stack::push(const Container::value_type& x);
void stack::pop();
const Container::value_type&
stack::top() const;
```

void Container::value\_type& stack::top();

### Comparision Operators

```
bool operator==(const stack& s0,
                  const stack& s1);
bool operator<(const stack& s0,
               const stack& s1);
```

## 3.2 Queue Adaptor

#include <queue>

```
template<class T,
         class Container=deque(T) >
class queue;
```

Default constructor. Container must have empty(), size(), back(), front(), push\_back() and pop\_front(). So list and deque can be used.

```
bool queue::empty() const;
Container::size_type queue::size() const;
```

```
void
queue::push(const Container::value_type& x);
void queue::pop();
const Container::value_type&
queue::front() const;
Container::value_type& queue::front();
const Container::value_type&
queue::back() const;
Container::value_type& queue::back();
```

### 3.3 Priority Queue

#include <queue>

```
template<class T,
         class Container=vector(T),
         class Compare=less(T) >
class priority_queue;
```

Container must provide random access iterator and have empty(), size(), front(), push\_back() and pop\_back(). So vector and deque can be used.

Mostly implemented as *heap*.

### 3.3.1 Constructors

```
explicit priority_queue::priority_queue(
    const Compare& comp=Compare());
priority_queue::priority_queue(
    InputIterator first,
    InputIterator last,
    const Compare& comp=Compare());
```

### 3.3.2 Members

```
bool priority_queue::empty() const;
Container::size_type
priority_queue::size() const;
const Container::value_type&
priority_queue::top() const;
```

Container::value\_type& priority\_queue::top();

void priority\_queue::push(
 const Container::value\_type& x);

void priority\_queue::pop();

No comparision operators.

## 4 Algorithms

```
#include <algorithm>
```

STL algorithms use iterator type parameters. Their *names* suggest their category (See 6.1). For abbreviation, the clause —

`template <class Foo, ...>` is dropped. The outlined leading character can suggest the `template` context.

**Note:** When looking at two sequences:  $S_1 = [first_1, last_1]$  and  $S_2 = [first_2, ?]$  or  $S_2 = [?, last_2]$  — caller is responsible that function will not overflow  $S_2$ .

### 4.1 Query Algorithms

```
Function // f not changing [first, last)
for_each(Iterator first,
         Iterator last,
         Function f);  $\Theta 7.4$ 
```

```
Iterator // first i so i==last or *i==val
find(Iterator first,
      Iterator last,
      const T val);  $\Theta 7.2$ 
```

```
Iterator // first i so i==last or pred(i)
find_if(Iterator first,
        Iterator last,
        Predicate pred);  $\Theta 7.7$ 
```

```
ForwardIterator // first duplicate
adjacent_find(ForwardIterator first,
              ForwardIterator last);
```

```
ForwardIterator // first binPred-duplicate
adjacent_find(ForwardIterator first,
              ForwardIterator last,
              BinaryPredicate binPred);
```

```
void // n = # equal val
count(ForwardIterator first,
      ForwardIterator last,
      const T val,
      Size& n);
```

```
void // n = # satisfying pred
count_if(ForwardIterator first,
         ForwardIterator last,
         Predicate pred,
         Size& n);
```

```
// ~ bi-pointing to first !=
pair(Iterator1, Iterator2)
mismatch(Iterator1 first1,
          Iterator1 last1,
          Iterator2 first2);
```

```
// ~ bi-pointing to first binPred-mismatch
pair(Iterator1, Iterator2)
mismatch(Iterator1 first1,
          Iterator1 last1,
          Iterator2 first2,
          BinaryPredicate binPred);
```

```
bool
equal(Iterator1 first1,
      Iterator1 last1,
      Iterator2 first2);
```

```
bool
equal(Iterator1 first1,
      Iterator1 last1,
      Iterator2 first2,
      BinaryPredicate binPred);
```

```
// [first2, last2) ⊆ [first1, last1)
ForwardIterator1
search(ForwardIterator1 first1,
      ForwardIterator1 last1,
      ForwardIterator2 first2,
      ForwardIterator2 last2);
```

```
// [first2, last2) ⊆ binPred [first1, last1)
ForwardIterator1
search(ForwardIterator1 first1,
      ForwardIterator1 last1,
      ForwardIterator2 first2,
      ForwardIterator2 last2,
      BinaryPredicate binPred);
```

### 4.2 Mutating Algorithms

```
OutputIterator // ~ first2 + (last1 - first1)
copy(Iterator first1,
      Iterator last1,
      OutputIterator first2);
// ~ last2 - (last1 - first1)
```

```
BidirectionalIterator2
copy_backward(
    BidirectionalIterator1 first1,
    BidirectionalIterator1 last1,
    BidirectionalIterator2 last2);
```

```
void swap(T& x, T& y);
```

```
ForwardIterator2 // ~ first2 + #[first1, last1)
swap_ranges(ForwardIterator1 first1,
            ForwardIterator1 last1,
            ForwardIterator2 first2);
```

```
OutputIterator // ~ result + (last1 - first1)
transform(Iterator first,
          Iterator last,
          OutputIterator result,
          UnaryOperation op);  $\Theta 7.6$ 
```

```
OutputIterator // ∀s_i^k ∈ S_k r_i = bop(s_i^1, s_i^2)
transform(Iterator1 first1,
          Iterator1 last1,
          Iterator2 first2,
          OutputIterator result,
          BinaryOperation bop);
```

```
void replace(ForwardIterator first,
             ForwardIterator last,
             const T& oldVal,
             const T& newVal);
```

```
void
replace_if(ForwardIterator first,
            ForwardIterator last,
            Predicate& pred,
            const T& newVal);
```

```
OutputIterator // ~ result2 + #[first, last)
replace_copy(Iterator first,
            Iterator last,
            OutputIterator result,
            const T& oldVal,
            const T& newVal);
```

```
OutputIterator // as above but using pred
replace_copy_if(Iterator first,
                Iterator last,
                OutputIterator result,
                Predicate& pred,
                const T& newVal);
```

```
void fill(ForwardIterator first,
          ForwardIterator last,
          const T& value);
```

```
void fill_n(ForwardIterator first,
            Size n,
            const T& value);
```

```
void // by calling gen()
generate(ForwardIterator first,
         ForwardIterator last,
         Generator gen);
```

```
void // n calls to gen()
generate_n(ForwardIterator first,
            Size n,
            Generator gen);
```

All variants of `remove` and `unique` return iterator to new end or past last copied.

```
ForwardIterator // (~,last) is all value
remove(ForwardIterator first,
       ForwardIterator last,
       const T& value);
```

```
ForwardIterator // as above but using pred
remove_if(ForwardIterator first,
          ForwardIterator last,
          Predicate pred);
```

```
OutputIterator // ~ past last copied
remove_copy(Iterator first,
            Iterator last,
            OutputIterator result,
            const T& value);
```

```
OutputIterator // as above but using pred
remove_copy_if(Iterator first,
               Iterator last,
               OutputIterator result,
               Predicate pred);
```

All variants of `unique` template functions remove consecutive (`binPred-`) duplicates. Thus useful after sort (See 4.3).

```
ForwardIterator // (~,last) gets repetitions
unique(ForwardIterator first,
       ForwardIterator last);
```

```
ForwardIterator // as above but using binPred
unique(ForwardIterator first,
       ForwardIterator last,
       BinaryPredicate binPred);
```

```
OutputIterator // ~ past last copied
unique_copy(Iterator first,
            Iterator last,
            OutputIterator result,
            const T& result);
```

```
OutputIterator // as above but using binPred
unique_copy(Iterator first,
            Iterator last,
            OutputIterator result,
            BinaryPredicate binPred);
```

```
void
reverse(BidirectionalIterator first,
        BidirectionalIterator last);
```

```
OutputIterator // ~ past last copied
reverse_copy(BidirectionalIterator first,
             BidirectionalIterator last,
             OutputIterator result);
```

```
void // with first moved to middle
rotate(ForwardIterator first,
       ForwardIterator middle,
       ForwardIterator last);
```

```
OutputIterator // first to middle position
rotate_copy(ForwardIterator first,
            ForwardIterator middle,
            ForwardIterator last,
            OutputIterator result);
```

```

void
random_shuffle(
    RandomAccessIterator first,
    RandomAccessIterator result);
void // rand() returns double in [0,1)
random_shuffle(
    RandomAccessIterator first,
    RandomAccessIterator last,
    RandomGenerator rand);

BidirectionalIterator // begin with true
partition(BidirectionalIterator first,
          BidirectionalIterator last,
          Predicate pred);

BidirectionalIterator // begin with true
stable_partition(
    BidirectionalIterator first,
    BidirectionalIterator last,
    Predicate pred);

```

### 4.3 Sort and Application

```

void sort(RandomAccessIterator first,
          RandomAccessIterator last);
void sort(RandomAccessIterator first,
          RandomAccessIterator last,
7.3 Compare comp);
void
stable_sort(RandomAccessIterator first,
             RandomAccessIterator last);
void
stable_sort(RandomAccessIterator first,
             RandomAccessIterator last,
             Compare comp);
void // [first,middle) sorted,
partial_sort( // [middle,last) eq-greater
    RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last);
void // as above but using comp( $e_i, e_j$ )
partial_sort(
    RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last,
    Compare comp);

RandomAccessIterator // post last sorted
partial_sort_copy(
    InputIterator first,
    InputIterator last,
    RandomAccessIterator resultFirst,
    RandomAccessIterator resultLast);

```

```

RandomAccessIterator
partial_sort_copy(
    InputIterator first,
    InputIterator last,
    RandomAccessIterator resultFirst,
    RandomAccessIterator resultLast,
    Compare comp);

Let  $n = position - first$ , nth_element
partitions  $[first, last)$  into:  $L = [first, position]$ ,
 $e_n, R = [position + 1, last)$  such that
 $\forall l \in L, \forall r \in R \quad l \geq e_n \leq r$ .
void
nth_element(
    RandomAccessIterator first,
    RandomAccessIterator position,
    RandomAccessIterator last);

void // as above but using comp( $e_i, e_j$ )
nth_element(
    RandomAccessIterator first,
    RandomAccessIterator position,
    RandomAccessIterator last,
    Compare comp);

7.5
4.3.1 Binary Search
bool
binary_search(ForwardIterator first,
               ForwardIterator last,
               const T& value);
bool
binary_search(ForwardIterator first,
               ForwardIterator last,
               const T& value,
               Compare comp);

ForwardIterator
lower_bound(ForwardIterator first,
            ForwardIterator last,
            const T& value);
ForwardIterator
lower_bound(ForwardIterator first,
            ForwardIterator last,
            const T& value,
            Compare comp);

ForwardIterator
upper_bound(ForwardIterator first,
            ForwardIterator last,
            const T& value);
ForwardIterator
upper_bound(ForwardIterator first,
            ForwardIterator last,
            const T& value,
            Compare comp);

```

equal\_range returns iterators pair that lower\_bound and upper\_bound return.

```

pair<ForwardIterator,ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last,
            const T& value);

pair<ForwardIterator,ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last,
            const T& value,
            Compare comp);

```

**7.5**

#### 4.3.2 Merge

Assuming  $S_1 = [first_1, last_1]$  and  $S_2 = [first_2, last_2]$  are sorted, stably merge them into  $[result, result + N]$  where  $N = |S_1| + |S_2|$ .

```

OutputIterator
merge(InputIterator1 first1,
       InputIterator1 last1,
       InputIterator2 first2,
       InputIterator2 last2,
       OutputIterator result);

```

```

OutputIterator
merge(InputIterator1 first1,
       InputIterator1 last1,
       InputIterator2 first2,
       InputIterator2 last2,
       OutputIterator result,
       Compare comp);

```

void // ranges [first,middle) [middle,last)
inplace\_merge( // into [first,last)
 BidirectionalIterator first,
 BidirectionalIterator middle,
 BidirectionalIterator last);

void // as above but using comp
inplace\_merge(
 BidirectionalIterator first,
 BidirectionalIterator middle,
 BidirectionalIterator last,
 Compare comp);

#### 4.3.3 Functions on Sets

Can work on *sorted associative* containers (see 2.7). For *multiset* the interpretation of — *union*, *intersection* and *difference* is by: *maximum*, *minimum* and *subtraction* of occurrences respectively.

Let  $S_i = [first_i, last_i)$  for  $i = 1, 2$ .

```

bool //  $S_1 \supseteq S_2$ 
includes(InputIterator1 first1,
         InputIterator1 last1,
         InputIterator2 first2,
         InputIterator2 last2);

bool // as above but using comp
includes(InputIterator1 first1,
         InputIterator1 last1,
         InputIterator2 first2,
         InputIterator2 last2,
         Compare comp);

OutputIterator //  $S_1 \cup S_2$ ,  $\sim$ past end
set_union(InputIterator1 first1,
          InputIterator1 last1,
          InputIterator2 first2,
          InputIterator2 last2,
          OutputIterator result);

OutputIterator // as above but using comp
set_union(InputIterator1 first1,
          InputIterator1 last1,
          InputIterator2 first2,
          InputIterator2 last2,
          OutputIterator result,
          Compare comp);

OutputIterator //  $S_1 \cap S_2$ ,  $\sim$ past end
set_intersection(InputIterator1 first1,
                 InputIterator1 last1,
                 InputIterator2 first2,
                 InputIterator2 last2,
                 OutputIterator result);

OutputIterator // as above but using comp
set_intersection(InputIterator1 first1,
                 InputIterator1 last1,
                 InputIterator2 first2,
                 InputIterator2 last2,
                 OutputIterator result,
                 Compare comp);

OutputIterator //  $S_1 \setminus S_2$ ,  $\sim$ past end
set_difference(InputIterator1 first1,
               InputIterator1 last1,
               InputIterator2 first2,
               InputIterator2 last2,
               OutputIterator result);

OutputIterator // as above but using comp
set_difference(InputIterator1 first1,
               InputIterator1 last1,
               InputIterator2 first2,
               InputIterator2 last2,
               OutputIterator result,
               Compare comp);

```

```
OutputIterator //  $S_1 \Delta S_2$ ,  $\sim$ past end
set_symmetric_difference(
    InputIterator1 first1,
    InputIterator1 last1,
    InputIterator2 first2,
    InputIterator2 last2,
    OutputIterator result);
```

```
OutputIterator // as above but using comp
set_symmetric_difference(
    InputIterator1 first1,
    InputIterator1 last1,
    InputIterator2 first2,
    InputIterator2 last2,
    OutputIterator result,
    Compare comp);
```

#### 4.3.4 Heap

```
void // (last - 1) is pushed
push_heap(RandomAccessIterator first,
          RandomAccessIterator last);
void // as above but using comp
push_heap(RandomAccessIterator first,
          RandomAccessIterator last,
          Compare comp);
void // first is popped
pop_heap(RandomAccessIterator first,
         RandomAccessIterator last);
void // as above but using comp
pop_heap(RandomAccessIterator first,
         RandomAccessIterator last,
         Compare comp);
void // [first,last) arbitrary ordered
make_heap(RandomAccessIterator first,
          RandomAccessIterator last);
void // as above but using comp
make_heap(RandomAccessIterator first,
          RandomAccessIterator last,
          Compare comp);
void // sort the [first,last) heap
sort_heap(RandomAccessIterator first,
          RandomAccessIterator last);
void // as above but using comp
sort_heap(RandomAccessIterator first,
          RandomAccessIterator last,
          Compare comp);
```

#### 4.3.5 Min and Max

```
 $\text{const } T\&$  min( $\text{const } T\& x0, \text{const } T\& x1$ );
 $\text{const } T\&$  min( $\text{const } T\& x0,$ 
 $\text{const } T\& x1,$ 
    Compare comp);
 $\text{const } T\&$  max( $\text{const } T\& x0, \text{const } T\& x1$ );
 $\text{const } T\&$  max( $\text{const } T\& x0,$ 
 $\text{const } T\& x1,$ 
    Compare comp);
```

```
ForwardIterator
min_element(ForwardIterator first,
            ForwardIterator last);
```

```
ForwardIterator
min_element(ForwardIterator first,
            ForwardIterator last,
            Compare comp);
```

```
ForwardIterator
max_element(ForwardIterator first,
            ForwardIterator last);
```

```
ForwardIterator
max_element(ForwardIterator first,
            ForwardIterator last,
            Compare comp);
```

#### 4.3.6 Permutations

To get all permutations, start with ascending sequence end with descending.

```
bool //  $\sim$  iff available
next_permutation(
    BidirectionalIterator first,
    BidirectionalIterator last);
```

```
bool // as above but using comp
next_permutation(
    BidirectionalIterator first,
    BidirectionalIterator last,
    Compare comp);
```

```
bool //  $\sim$  iff available
prev_permutation(
    BidirectionalIterator first,
    BidirectionalIterator last);
```

```
bool // as above but using comp
prev_permutation(
    BidirectionalIterator first,
    BidirectionalIterator last,
    Compare comp);
```

#### 4.3.7 Lexicographic Order

```
bool lexicographical_compare(
    InputIterator1 first1,
    InputIterator1 last1,
    InputIterator2 first2,
    InputIterator2 last2);
```

```
bool lexicographical_compare(
    InputIterator1 first1,
    InputIterator1 last1,
    InputIterator2 first2,
    InputIterator2 last2,
    Compare comp);
```

#### 4.4 Computational

```
#include <numeric>
```

$T // \sum_{[first,last)}$   $\Rightarrow$  7.6  
 $\text{accumulate}(\text{InputIterator first},$ 
 $\text{InputIterator last},$ 
 $T initVal);$

$T // \text{as above but using binop}$   
 $\text{accumulate}(\text{InputIterator first},$ 
 $\text{InputIterator last},$ 
 $T initVal,$ 
 $\text{BinaryOperation binop});$

$T // \sum_i e_i^1 \times e_i^2 \text{ for } e_i^k \in S_k, (k = 1, 2)$   
 $\text{inner_product}(\text{InputIterator1 first1},$ 
 $\text{InputIterator1 last1},$ 
 $\text{InputIterator2 first2},$ 
 $T initVal);$

$T // \text{Similar, using } \sum^{(\text{sum})} \text{ and } \times \text{ mult}$   
 $\text{inner_product}(\text{InputIterator1 first1},$ 
 $\text{InputIterator1 last1},$ 
 $\text{InputIterator2 first2},$ 
 $T initVal,$ 
 $\text{BinaryOperation sum},$ 
 $\text{BinaryOperation mult});$

$\text{OutputIterator} // r_k = \sum_{i=first}^{first+k} e_i$   
 $\text{partial_sum}(\text{InputIterator first},$ 
 $\text{InputIterator last},$ 
 $\text{OutputIterator result});$

$\text{OutputIterator} // \text{as above but using binop}$   
 $\text{partial_sum}(\text{InputIterator first},$ 
 $\text{InputIterator last},$ 
 $\text{OutputIterator result},$ 
 $\text{BinaryOperation binop});$

$\text{OutputIterator} // r_k = s_k - s_{k-1} \text{ for } k > 0$   
 $\text{adjacent_difference} // r_0 = s_0$

```
InputIterator first,
InputIterator last,
OutputIterator result);
```

$\text{OutputIterator} // \text{as above but using binop}$   
 $\text{adjacent_difference}$

```
InputIterator first,
InputIterator last,
OutputIterator result,
BinaryOperation binop);
```

## 5 Function Objects

```
#include <functional>
```

```
template<class Arg, class Result>
struct unary_function {
    typedef Arg argument_type;
    typedef Result result_type;}
```

Derived unary objects:  
**struct negate**( $T$ );  
**struct logical\_not**( $T$ );  
 $\Rightarrow$  7.6

```
template<class Arg1, class Arg2,
        class Result>
struct binary_function {
    typedef Arg1 first_argument_type;
    typedef Arg2 second_argument_type;
    typedef Result result_type;}
```

Following derived template objects accept two operands. Result obvious by the name.

```
struct plus( $T$ );
struct minus( $T$ );
struct multiplies( $T$ );
struct divides( $T$ );
struct modulus( $T$ );
struct equal_to( $T$ );
struct not_equal_to( $T$ );
struct greater( $T$ );
struct less( $T$ );
struct greater_equal( $T$ );
struct less_equal( $T$ );
struct logical_and( $T$ );
struct logical_or( $T$ );
```

## 5.1 Function Adaptors

### 5.1.1 Negators

```
template(class Predicate)
class unary_negate : public
    unary_function(Predicate::argument_type,
        bool);
```

```
unary_negate::unary_negate(Predicate pred);
bool // negate pred
unary_negate::operator()(Predicate::argument_type x);
unary_negate(Predicate);
not1(const Predicate pred);
```

```
template(class Predicate)
class binary_negate : public
    binary_function(
        Predicate::first_argument_type,
        Predicate::second_argument_type);
        bool);
```

```
binary_negate::binary_negate(Predicate pred);
bool // negate pred
binary_negate::operator()(Predicate::first_argument_type x,
    Predicate::second_argument_type y);
binary_negate(Predicate);
not2(const Predicate pred);
```

### 5.1.2 Binders

```
template(class Operation)
class binder1st: public
    unary_function(
        Operation::second_argument_type,
        Operation::result_type);
```

```
binder1st::binder1st(const Operation& op,
    const Operation::first_argument_type y);
// argument_type from unary_function
Operation::result_type
binder1st::operator()(const binder1st::argument_type x);
binder1st(Operation);
bind1st(const Operation& op, const T& x);
```

```
template(class Operation)
class binder2nd: public
    unary_function(
        Operation::first_argument_type,
        Operation::result_type);

binder2nd::binder2nd(const Operation& op,
    const Operation::second_argument_type y);
// argument_type from unary_function
Operation::result_type
binder2nd::operator()(const binder2nd::argument_type x);
binder2nd(Operation);
bind2nd(const Operation& op, const T& x);
```

### 5.1.3 Pointers to Functions

```
template(class Arg, class Result)
class pointer_to_unary_function :
    public unary_function(Arg, Result);
```

```
pointer_to_unary_function(Arg, Result)
ptr_fun(Result(*x)(Arg));
```

```
template<class Arg1, class Arg2,
        class Result>
class pointer_to_binary_function :
    public binary_function(Arg1, Arg2,
        Result);
```

```
pointer_to_binary_function(Arg1, Arg2,
    Result)
ptr_fun(Result(*x)(Arg1, Arg2));
```

## 6 Iterators

```
#include <iterator>
```

### 6.1 Iterators Categories

Here, we will use:

- X iterator type.
- a, b iterator values.
- r iterator reference (**X&** r).
- t a value type T.

Imposed by empty struct tags.

#### 6.1.1 Input, Output, Forward

```
struct input_iterator_tag {}7.8
struct output_iterator_tag {}
struct forward_iterator_tag {}
```

In table follows requirements check list for Input, Output and Forward iterators.

Expression	Requirements	I	O	F
X()	might be singular			•
X u				•
X(a)	$\Rightarrow X(a) == a$ $*a=t \Leftrightarrow *X(a)=t$	•	•	•
X u(a)	$\Rightarrow u == a$	•	•	•
X u=a	u copy of a			•
a==b	equivalence relation	•	•	•
a!=b	$\Leftrightarrow ! (a==b)$	•	•	•
r = a	$\Rightarrow r == a$			•
*a	convertible to T.	•	•	•
*a=t	$\Leftrightarrow a==*b$ (for forward, if X mutable)	•	•	•
++r	result is dereferenceable or past-the-end. $\&r == ++r$	•	•	•
	convertible to const X&	•	•	
	convertible to X&			•
	$r==s \Leftrightarrow ++r==++s$			•
r++	convertible to X& $\Leftrightarrow \{X x=r; ++r; return x;\}$	•	•	•
++r	convertible to T	•	•	•
r++				•

<sup>7.7.</sup>

#### 6.1.2 Bidirectional Iterators

```
struct bidirectional_iterator_tag {}
```

The forward requirements and:

- r Convertible to **const** X&. If  $\exists r=++s$  then --r refers same as s.  $\&r==\&--r$ .
- (++)==r.  $(--r == --s \Rightarrow r==s)$ .
- $\Rightarrow \{X x=r; --r; return x;\}$ .

#### 6.1.3 Random Access Iterator

```
struct random_access_iterator_tag {}
```

The bidirectional requirements and (m,n iterator's distance (integral) value):

- $r+=n \Leftrightarrow \{for (m=n; m->0; ++r); for (m=n; m++<0; --r); return r;\}$  //but time = O(1).
- $a+n \Leftrightarrow n+a \Leftrightarrow \{X x=a; return a+=n\}$
- $r-=n \Leftrightarrow r += -n$ .
- $a-n \Leftrightarrow a+(-n)$ .
- b-a Returns iterator's distance value n, such that  $a+n == b$ .
- $a[n] \Leftrightarrow *(a+n)$ .
- $a < b$  Convertible to bool, < total ordering.
- $a < b$  Convertible to bool, > opposite to <.
- $a \leq b \Leftrightarrow !(a > b)$ .
- $a \geq b \Leftrightarrow !(a < b)$ .

<sup>7.4.</sup>

## 6.2 Stream Iterators

```
template(class T,
        class Distance=ptrdiff_t)
class istream_iterator :
    public iteratorT, Distance);
```

// end of stream <sup>7.4</sup>

```
istream_iterator::istream_iterator();
```

```
istream_iterator::istream_iterator(istream& s); 7.4
```

```
istream_iterator::istream_iterator(const istream& s);
```

```
istream_iterator& // Read and store T value
istream_iterator::operator++() const;
```

```
bool // all end-of-streams are equal
operator==(const istream& s,
            const istream& t);
```

```
template(class T)
class ostream_iterator :
    public iterator;
```

```
// If delim != 0 add after each write
ostream_iterator::ostream_iterator(ostream& s,
                                const char* delim=0);
```

```
ostream_iterator::ostream_iterator(const ostream& s);
```

```
ostream_iterator& // Assign & write (*o=t)
ostream_iterator::operator*() const;
```

```
ostream_iterator& operator=(const ostream& s);
```

```
ostream_iterator& // No-op
ostream_iterator::operator++();
```

```
ostream_iterator& // No-op
ostream_iterator::operator++(int);
```

<sup>7.4.</sup>

## 6.3 Typedefs & Adaptors

```
template<Category, T,
         Distance=ptrdiff_t,
         Pointer=T*, Reference= T&>
class iterator {
    Category iterator_category;
    T value_type;
    Distance difference_type;
    Pointer pointer;
    Reference reference;}
```

### 6.3.1 Traits

```
template<I>
class iterator_traits {
    I::iterator_category iterator_category;
    I::value_type value_type;
    I::difference_type difference_type;
    I::pointer pointer;
    I::reference reference;}
```

Pointer specializations: 7.8

```
template<T>
class iterator_traits<T*> {
    random_access_iterator_tag
        iterator_category ;
    T value_type;
    ptrdiff_t difference_type;
    T* pointer;
    T& reference;}
```

```
template<T>
class iterator_traits<const T*> {
    random_access_iterator_tag
        iterator_category ;
    T value_type;
    ptrdiff_t difference_type;
    const T* pointer;
    const T& reference;}
```

### 6.3.2 Reverse Iterator

Transform  $[i \nearrow j] \mapsto [j - 1 \searrow i - 1]$ .

```
template<Iter>
class reverse_iterator : public iterator<
    iterator_traits<Iter>::iterator_category,
    iterator_traits<Iter>::value_type,
    iterator_traits<Iter>::difference_type,
    iterator_traits<Iter>::pointer,
    iterator_traits<Iter>::reference>{
```

Denote  
 $\text{RI} = \text{reverse\_iterator}$   
 $\text{AI} = \text{RandomAccessIterator}$ .  
Abbreviate:  
 $\text{typedef RI}<\text{AI}, \text{T},$   
 $\text{Reference, Distance}\rangle \text{ self};$   
*// Default constructor  $\Rightarrow$  singular value*  
 $\text{self}.\text{RI}();$   
*explicit // Adaptor Constructor*  
 $\text{self}.\text{RI}(\text{AI}i);$   
 $\text{AI} \text{ self}.\text{base}(); // adpatee's position$

*// so that:  $\&*(\text{RI}(i)) == \&*(i-1)$  Reference*  
 $\text{self}.\text{operator}*&();$

$\text{self} // position to & return base()-1$   
 $\text{RI}.\text{operator}++();$

$\text{self} \& // return old position and move$   
 $\text{RI}.\text{operator}++(\text{int}); // to base()-1$

$\text{self} // position to & return base() + 1$   
 $\text{RI}.\text{operator}--();$

$\text{self} \& // return old position and move$   
 $\text{RI}.\text{operator}--(\text{int}); // to base() + 1$

$\text{bool} // \Leftrightarrow s0.\text{base}() == s1.\text{base}()$   
 $\text{operator}=(\text{const} \text{ self} \& s0, \text{const} \text{ self} \& s1);$

#### reverse\_iterator Specific

$\text{self} // returned value positioned at base() - n$   
 $\text{reverse\_iterator}.\text{operator}+(\text{Distance} n) \text{ const};$

$\text{self} \& // change & return position to base() - n$   
 $\text{reverse\_iterator}.\text{operator}+(\text{Distance} n);$

$\text{self} // returned value positioned at base() + n$   
 $\text{reverse\_iterator}.\text{operator}-(\text{Distance} n) \text{ const};$

$\text{self} \& // change & return position to base() + n$   
 $\text{reverse\_iterator}.\text{operator}-(\text{Distance} n);$

$\text{Reference} // *(\text{this} + n)$   
 $\text{reverse\_iterator}.\text{operator}[](\text{Distance} n);$

$\text{Distance} // r0.\text{base}() - r1.\text{base}()$   
 $\text{operator}-(\text{const} \text{ self} \& r0, \text{const} \text{ self} \& r1);$

$\text{self} // n + r.\text{base}()$   
 $\text{operator}-(\text{Distance} n, \text{const} \text{ self} \& r);$

$\text{bool} // r0.\text{base}() < r1.\text{base}()$   
 $\text{operator}<(\text{const} \text{ self} \& r0, \text{const} \text{ self} \& r1);$

## 6.3.3 Insert Iterators

```
template<class Container>
class back_insert_iterator : public output_iterator;
```

```
template<class Container>
class front_insert_iterator : public output_iterator;
```

```
template<class Container>
class insert_iterator : public output_iterator;
```

Here T will denote the Container::value\_type.  
**Constructors**

*explicit //  $\exists$  Container::push\_back( $\text{const} \text{ T}\&$ )*  
 $\text{back\_insert\_iterator}.\text{back\_insert\_iterator}($   
 $\text{Container} \& x);$

*explicit //  $\exists$  Container::push\_front( $\text{const} \text{ T}\&$ )*  
 $\text{front\_insert\_iterator}.\text{front\_insert\_iterator}($   
 $\text{Container} \& x);$

*//  $\exists$  Container::insert( $\text{const} \text{ T}\&$ )*  
 $\text{insert\_iterator}.\text{insert\_iterator}($

$\text{Container} \quad x,$   
 $\text{Container}.\text{iterator} \quad i);$

Denote

$\text{InsIter} = \text{back\_insert\_iterator}$   
 $\text{insFunc} = \text{push\_back}$   
 $\text{iterMaker} = \text{back\_inserter}$  7.4

or

$\text{InsIter} = \text{front\_insert\_iterator}$   
 $\text{insFunc} = \text{push\_front}$   
 $\text{iterMaker} = \text{front\_inserter}$

or

$\text{InsIter} = \text{insert\_iterator}$   
 $\text{insFunc} = \text{insert}$

## Member Functions & Operators

$\text{InsIter} \& // calls x.insFunc(val)$   
 $\text{InsIter}.\text{operator}=(\text{const} \text{ T}\& val);$

$\text{InsIter} \& // return *this$

$\text{InsIter}.\text{operator}*&();$

$\text{InsIter} \& // no-op, just return *this$   
 $\text{InsIter}.\text{operator}++();$

$\text{InsIter} \& // no-op, just return *this$   
 $\text{InsIter}.\text{operator}++(\text{int});$

## Template Function

$\text{InsIter} // return InsIter(Container)(x)$   
 $\text{iterMaker}(\text{Container} \& x);$

*// return insert\_iterator(Container)(x, i)*  
 $\text{insert\_iterator}(\text{Container})$

$\text{insserter}(\text{Container} \& x, \text{Iterator} i);$

## 7 Examples

### 7.1 Vector

```
// safe get
int vi(const vector<unsigned>& v, int i)
{ return(i < (int)v.size() ? (int)v[i] : -1); }
```

```
// safe set
void vin(vector<int>& v, unsigned i, int n) {
    int nAdd = i - v.size() + 1;
    if (nAdd > 0) v.insert(v.end(), nAdd, n);
    else v[i] = n;
}
```

### 7.2 List Splice

```
void lShow(ostream& os, const list<int>& l) {
    ostream_iterator<int> os1(os, " ");
    copy(l.begin(), l.end(), os1); os1<<endl;}
```

```
void lmShow(ostream& os, const char* msg,
           const list<int>& l,
           const list<int>& m) {
    os << msg << (m.size() ? ":" : "\n");
    lShow(os, l);
    if (m.size()) lmShow(os, m); } // lmShow
```

```
list<int>::iterator p(list<int>& l, int val)
{ return find(l.begin(), l.end(), val); }
```

```
static int prim[] = {2, 3, 5, 7};
static int perf[] = {6, 28, 496};
const list<int> lPrimes(prim+0, prim+4);
const list<int> lPerfектs(perf+0, perf+3);
list<int> l(lPrimes), m(lPerfектs);
lmShow(cout, "primes & perfects", l, m);
l.splice(l.begin(), m);
```

```
lmShow(cout, "splice(l.begin(), m)", l, m);
l = lPrimes; m = lPerfектs;
l.splice(l.begin(), m, p(m, 28));
lmShow(cout, "splice(l.begin(), m, p(m, 28))", l, m);
m.erase(m.begin(), m.end()); // =>m.clear()
l = lPrimes;
```

```
l.splice(p(1, 3), l, p(1, 5));
lmShow(cout, "5 before 3", l, m);
l = lPrimes;
l.splice(l.begin(), l, p(1, 7), l.end());
lmShow(cout, "tail to head", l, m);
l = lPrimes;
```

```
l.splice(l.end(), l, 1.begin(), p(1, 3));
lmShow(cout, "head to tail", l, m);
```

```
primes & perfects:
2 3 5 7
6 28 496
```

splice(l.begin(), m): 6 28 496 2 3 5 7

splice(l.begin(), m, ^28):

28 2 3 5 7

6 496

5 before 3: 2 5 3 7

tail to head: 7 2 3 5

head to tail: 3 5 7 2

## 7.3 Compare Object Sort

```
class ModN {
public:
    ModN(unsigned m) : _m(m) {}
    bool operator ()(const unsigned& u0,
                      const unsigned& u1)
        {return ((u0 % _m) < (u1 % _m));}
private: unsigned _m;
}; // ModN

ostream_iterator<unsigned> oi(cout, " ");
unsigned q[6];
for (int n=6, i=n-1; i>=0; n=i--)
    q[i] = n*n*n;
cout<<"four-powers: ";
copy(q + 0, q + 6, oi);
for (unsigned b=10; b<=1000; b *= 10) {
    vector<unsigned> sq(q + 0, q + 6);
    sort(sq.begin(), sq.end(), ModN(b));
    cout<<endl<<"sort mod "<<setw(4)<<<" : ";
    copy(sq.begin(), sq.end(), oi);
} cout << endl;
```

```
four-powers: 1 16 81 256 625 1296
sort mod 10: 1 81 625 16 256 1296
sort mod 100: 1 16 625 256 81 1296
sort mod 1000: 1 16 81 256 1296 625
```

## 7.4 Stream Iterators

```
void unitRoots(int n) {
    cout << "unit " << n << "-roots:" << endl;
    vector<complex<float>> roots;
    float arg = 2.*M_PI/(float)n;
    complex<float> r, r1 = polar((float)1., arg);
    for (r = r1; -n; r *= r1)
        roots.push_back(r);
    copy(roots.begin(), roots.end(),
         ostream_iterator<complex<float>>(cout,
                                             "\n"));
} // unitRoots
```

```
{ofstream o("primes.txt"); o << "2 3 5";}
ifstream pream("primes.txt");
vector<int> p;
istream_iterator<int> priter(pream);
istream_iterator<int> eos;
copy(priter, eos, back_inserter(p));
for_each(p.begin(), p.end(), unitRoots);

❸❹❻❺
```

```
unit 2-roots:
(-1.000,-0.000)
unit 3-roots:
(-0.500,0.866)
(-0.500,-0.866)
unit 5-roots:
(0.309,0.951)
(-0.809,0.588)
```

```
(-0.809,-0.588)
(0.309,-0.951)
```

## 7.5 Binary Search

```
// first 5 Fibonacci
static int fb5[] = {1, 1, 2, 3, 5};
for (int n = 0; n <= 6; ++n) {
    pair<int*,int*> p =
        equal_range(fb5, fb5+5, n);
    cout << n << ":"["<< p.first-fb5 << ',''
                           << p.second-fb5 << ") "];
    if (n==3 || n==6) cout << endl;
}

❸❹❻❺
```

```
0:[0,0) 1:[0,2) 2:[2,3) 3:[3,4)
4:[4,4) 5:[4,5) 6:[5,5)
```

## 7.6 Transform & Numeric

```
template <class T>
class AbsPwr : public unary_function<T, T> {
public:
    AbsPwr(T p): _p(p) {}
    T operator()(const T& x) const
        { return pow(fabs(x), _p); }
private: T _p;
}; // AbsPwr
```

```
template<typename InpIter> float
normNP(InpIter xb, InpIter xe, float p) {
    vector<float> vf;
    transform(xb, xe, back_inserter(vf),
              AbsPwr<float>(p > 0. ? p : 1.));
    return( (p > 0.)
            ? pow(accumulate(vf.begin(), vf.end(), 0.,
                            1./p)
                  : *max_element(vf.begin(), vf.end())));
} // normNP
```

```
float distNP(const float* x, const float* y,
             unsigned n, float p) {
    vector<float> diff;
    transform(x, x + n, y, back_inserter(diff),
              minus<float>());
    return normNP(diff.begin(), diff.end(), p);
} // distNP
```

```
float x3y4[] = {3., 4., 0.};
float z12[] = {0., 0., 12.};
float p[] = {1., 2., M_PI, 0.};
for (int i=0; i<4; ++i) {
    float d = distNP(x3y4, z12, 3, p[i]);
    cout << "d_{" << p[i] << "}=" << d << endl;
}
```

```
d_{1}=19
d_{2}=13
d_{3.14159}=12.1676
d_{0}=12
```

## 7.7 Iterator and Binder

```
// self-refering int
class Interator : public
    iterator<input_iterator_tag, int, size_t> {
    int _n;
public:
    Interator(int n=0) : _n(n) {}
    int operator*() const {return _n;}
    Interator& operator++() {
        ++_n; return *this; }
    Interator operator++(int) {
        Interator t(*this);
        ++_n; return t; }
}; // Interator
bool operator==(const Interator& i0,
                  const Interator& i1)
{ return (*i0 == *i1); }
bool operator!=(const Interator& i0,
                  const Interator& i1)
{ return !(i0 == i1); }
```

```
struct Fermat: public
    binary_function<int, int, bool> {
    Fermat(int p=2) : n(p) {}
    int n;
    int nPower(int t) const { // t^n
        int i=n, tn=1;
        while (i--) tn *= t;
        return tn; } // nPower
    int nRoot(int t) const {
        return (int)pow(t + 1, 1./n); }
    int xNyN(int x, int y) const {
        return (nPower(x)+nPower(y)); }
    bool operator()(int x, int y) const {
        int zn = xNyN(x, y), z = nRoot(zn);
        return (zn == nPower(z)); }
} // Fermat
```

```
for (int n=2; n<=Mp; ++n) {
    Fermat fermat(n);
    for (int x=1; x<Mx; ++x) {
        binderlist<Fermat>
            fx = bindist(fermat, x);
        Interator iy(x), iyEnd(My);
        while ((iy = find_if(++iy, iyEnd, fx))
               != iyEnd) {
            int y = *iy,
                z = fermat.nRoot(fermat.xNyN(x, y));
            cout << x << '^' << n << " + "
                << y << '^' << n << " = "
                << z << '^' << n << endl;
            if (n>2)
                cout << "Fermat is wrong!" << endl;
        }
    }
}
```

```
3^2 + 4^2 = 5^2
5^2 + 12^2 = 13^2
6^2 + 8^2 = 10^2
7^2 + 24^2 = 25^2
```

## 7.8 Iterator Traits

```
template <class Itr>
typename iterator_traits<Itr>::value_type
mid(Itr b, Itr e, input_iterator_tag) {
    cout << "mid(general):\n";
    Itr bm(b); bool next = false;
    for ( ; b != e; ++b, next = !next) {
        if (next) { ++bm; }
    }
    return *bm;
} // mid<input>
```

```
template <class Itr>
typename iterator_traits<Itr>::value_type
mid(Itr b, Itr e,
     random_access_iterator_tag) {
    cout << "mid(random):\n";
    Itr bm = b + (e - b)/2;
    return *bm;
} // mid<random>
```

```
template <class Itr>
typename iterator_traits<Itr>::value_type
mid(Itr b, Itr e) {
    typename
        iterator_traits<Itr>::iterator_category t;
    mid(b, e, t);
} // mid
```

```
template <class Ctr>
void fillmid(Ctr& ctr) {
    static int perfects[5] =
        {6, 14, 496, 8128, 33550336},
        *pb = &perfects[0];
    ctr.insert(ctr.end(), pb, pb + 5);
    int m = mid(ctr.begin(), ctr.end());
    cout << "mid=" << m << "\n";
} // fillmid
```

```
list<int> l; vector<int> v;
fillmid(l); fillmid(v);
```

```
mid(general):
mid=496
mid(random):
mid=496
```
